Weather Evidence Report

Report ID **WE-2024-04-26-3BF16776DB95** · Data retrieved Nov 5, 2026, 10:05 AM CST

1819 FARNAM ST, OMAHA, NE, 68183

Date of loss **April 26, 2024** · local day in America/Chicago

Property · Weather station · Warning area · Tornado path · Radar hail · Hail report · Wind report · Tornado report

PEAK WIND GUST	WARNING AREA	NEAREST TORNADO	LARGEST HAIL WITHIN 5 MI
61 mph	**Inside**	**EF1**	**1.75 in**
5:06 PM CDT · KOMA, 4.2 mi NNE	Flash Flood Warning & Severe Thunderstorm Warning & Tornado Warning (4) · 4:26 PM CDT – 7:08 PM CDT	Path 2.1 mi E at its closest	Reported 2.7 mi NE, 4:55 PM CDT

Each fact names the record it comes from; details and limitations follow. Records near the property do not by themselves establish conditions at it.

Location

Coordinates	41.25756, -95.94013
County · NWS zones · office	Douglas County, NE · NEC055, NEZ052 · OAX
Location method	US Census Geocoder address match
Address as entered	1819 Farnam St, Omaha, NE 68183
Local day	Apr 26, 2024, 12:00 AM CDT to Apr 27, 2024, 12:00 AM CDT (2024-04-26 05:00Z–2024-04-27 05:00Z)

Key findings

Peak wind gust, nearest reporting station	**61 mph** (53 kt) at 5:06 PM CDT — Omaha Eppley Airfield KOMA, 4.2 mi NNE of the site
Liquid precipitation, nearest station	**0.69 in** at KOMA — **incomplete**: 3 of 24 hourly periods have no usable report
Most precipitation, other listed stations	**1.17 in** at Bellevue Offutt Afb (USW00014949), 9.8 mi S — 7 hour(s) missing
Temperature range, nearest station	52–71 °F
Warnings whose polygon contained the site	**4**: Tornado Warning 2024-KOAX-TO-W-0031 (4:26 PM CDT–5:15 PM CDT); Flash Flood Warning 2024-KOAX-FF-W-0005 (4:32 PM CDT–7:08 PM CDT); Tornado Warning 2024-KOAX-TO-W-0034 (4:54 PM CDT–5:09 PM CDT); Severe Thunderstorm Warning 2024-KOAX-SV-W-0041 (5:26 PM CDT–5:39 PM CDT)
Watches / advisories for the site's county or zone	Tornado Watch
Nearest tornado (Storm Events)	**EF1**, path passed **2.1 mi E** of the site at its closest; 1.12 mi long, 75 yd wide (event 1167514)
Largest hail reported within 5 mi (LSR)	**1.75 inch** (estimated), 2.7 mi NE, 4:55 PM CDT
Largest radar-estimated hail within 5 mi	**2.50 in**, 2.6 mi NW, 4:59 PM CDT (KOAX)

Each finding names the record it comes from. Records near the site do not by themselves establish conditions at the property. Detailed records and their limitations follow.

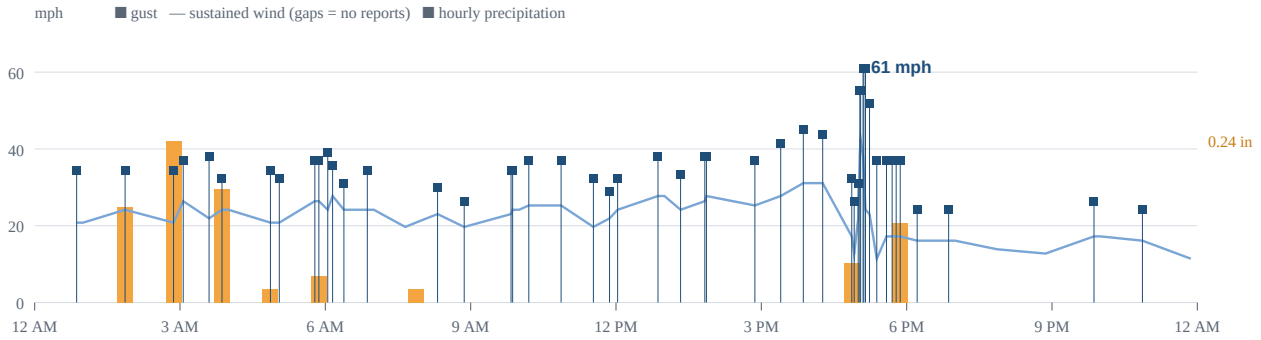

Station-pinned measurements

NOAA GHCNh hourly observations from the nearest stations that reported on April 26, 2024. Every value below was measured at the named station; nothing is blended, averaged across stations or interpolated to the site.

Station	Position from site	Reports	Peak gust	Max sustained	Precip (in)	Temp °F
Omaha Eppley Airfield USW00014942 · KOMA ASOS/AWOS airport station (METAR)	4.2 mi NNE	62	61 mph · 5:06 PM CDT	43 mph · 5:03 PM CDT	0.69 (3 missing hr)	52–71
Council Bluffs Ap USW00004908 · KCBF ASOS/AWOS airport station (METAR)	9.4 mi E	72	43 mph · 5:55 PM CDT	30 mph · 4:35 PM CDT	0.00	52–70
Bellevue Offutt Afb USW00014949 · KOFF ASOS/AWOS airport station (METAR)	9.8 mi S	39	48 mph · 5:39 PM CDT	36 mph · 4:55 PM CDT	1.17 (7 missing hr)	52–72
Millard Ap Omaha USW00004992 · KMLE ASOS/AWOS airport station (METAR)	9.9 mi WSW	72	46 mph · 4:35 PM CDT	26 mph · 4:35 PM CDT	0.06	52–72

Observation log — Omaha Eppley Airfield (KOMA), 4.2 mi NNE of the site

Station USW00014942 at 41.3119, -95.9019, elevation 299 m; ASOS/AWOS airport station (METAR). All 62 reports in the local day are listed: routine hourly METARs and special reports (SPECI) issued when conditions changed.

Wind is the reported 2-minute sustained speed; gust is the peak short-duration speed in the report. A 'PK WND' remark gives the highest instantaneous wind since the previous routine report and is included in the peak gust where it is higher. The highlighted row holds the peak gust.

Precipitation in a report is the running total since the last routine METAR. A blank means the report carried no precipitation group. '<0.01' is a measured trace.

3 hourly precipitation period(s) had no routine report or the station reported its precipitation sensor or amount as unavailable; the daily total excludes them and should be treated as a minimum.

QC: GHCNh quality codes other than 'passed' are shown as element:code (see Sources and limitations).

Some reports end with '$', the ASOS maintenance indicator: the station flagged that a sensor needed maintenance when it sent them.

NWS watches, warnings and advisories

Every NWS VTEC event in effect for the site's location during April 26, 2024. For polygon-based warnings, each bulletin's polygon is tested against the site's coordinates.

Event / NWS event ID	In effect (local)	Site relation	Bulletins
Tornado Watch 2024-KOAX-TO-A-0140	Apr 26, 2024, 12:53 PM CDT – 6:28 PM CDT	County/zone listed (NEC055)	3
Tornado Warning 2024-KOAX-TO-W-0017	Apr 26, 2024, 3:03 PM CDT – 3:45 PM CDT	Outside polygon — 6.1 mi from its edge	4
Tornado Warning 2024-KOAX-TO-W-0022	Apr 26, 2024, 3:41 PM CDT – 4:15 PM CDT	Outside polygon — 5.5 mi from its edge	5
Severe Thunderstorm Warning 2024-KOAX-SV-W-0036	Apr 26, 2024, 4:18 PM CDT – 5:00 PM CDT	Outside polygon — 16.1 mi from its edge	2

Report remarks (as issued)

#	Remark	Product
L03	The EF3 tornado developed about one quarter mile west of the West Q Road and 255th St intersection in Western Douglas county where trees were knocked down and a farmstead sustained outbuilding damage. The tornado continued northeast crossing agricultural fields and flipping numerous center pivots, eventually crossing 252nd Street. The tornado caused EF-2 damage as it approached Highway 92, damaging numerous homes and striking an acreage northwest of the Highway 92(West Center street) and Highway 275 Intersection where EF-2 damage was indicated. Several center pivots along Highway 275 were overturned as the tornado continued northeast crossing east of Highway 275 damaging several acreages, homes, and outbuildings along Highway 275/240th Street where EF-2 damage was sustained. Continuing its northeast path, the tornado crossed 234th Street near Harney Street where it damaged a horse farm and an acreage as well as a home along Dodge Street/Highway 6 before crossing Dodge Street causing roof and outbuilding damage at the Junkstock Farm. The tornado crossed the Elkhorn River, damaging trees and flipping center pivots in acreage along Blondo Street just south of the railroad tracks. The tornado continued into the western part of Elkhorn approximately one-half mile south southwest of the intersection of West Maple Road and 216th Street. Several homes sustained high- end EF-2 damage with homes losing large sections of their roofs and one home being shifted off its foundation. The tornado moved across Prospect Hills Cemetery damaging headstones, moving across West Maple Avenue severely damaging a landscape business before moving into the Ramblewood subdivision. Numerous homes in the subdivision were left with only small interior rooms standing sustaining EF-3 damage. The tornado continued northward across damaging homes between 212th Street and Kestrel Parkway, again leaving only interior rooms standing, with EF-3 damage sustained. The tornado crossed Fort Street about one-third of a mile east of 216th Street, causing the collapse of new development homes, with EF-3 damage being sustained. It veered to the northeast across mainly rural areas of Douglas County, between Fort Street and Military Road, becoming about one- mile wide as it crossed Highway 31, snapping power poles and large trees, producing EF-1 damage. The tornado narrowed to about one-half mile wide and moved into residential development just northwest of the intersection of 180th Street and Military Road, where EF-1 damage due to loss of roofs, was sustained. The tornado moved into Benningtonâ■■s Newport Landing neighborhood, removing large sections of several homes roofs and collapsing outside walls, sustaining EF-2 damage. The tornado moved across Newport Landing Lake, crossing near the intersection of Highway 36 and 168th Street, snapping the tops off of numerous trees. It then moved across agricultural land, damaging farm outbuildings southeast of the intersection of 168th Street and Dutch Hall Road, before crossing into Washington County. The tornado damaged homes and farm outbuildings east of County Road 29 and west of County Road 31 from Dutch Hall Road to County Road 36, ranging in width from one-third to one-half mile wide. The most significant damage was sustained to a home, machine shop and horse barn, one-third of a mile southeast of the intersection of County Road 40 and County Road 29, with high-end EF-3 damage occurring. Trees were snapped and debarked, the house was moved from its foundation, flat-bed and horse-trailers rolled or lofted, and the machine shop and horse barns destroyed. At least one horse was killed, and several others were injured. The tornado crossed the intersection of County Road 36 and County Road 31, producing EF-0 to EF-1 damage in the form of partial roof and siding loss to farm buildings and manufactured homes, plus snapping large tree limbs. As it approached State Highway 133, several homes and farm outbuildings sustained EF-2 damage due to the loss of roofs or exterior walls. Crossing Highway 133, the tornado was just less than one-half mile wide, and moved into residential areas generally between County Road 32 and US Highway 75. The most significant damage occurred near the intersections of County Road P30 and County Road 33 with nearly the complete destruction of several homes, with high-end EF-3 damage being sustained. The tornado crossed US75 about 2 miles southeast of Blair moving across the very southern portion of the Cargill plant. The tornado weakened and narrowed, but snapped power poles and derailed several empty rail container cars from the tracks, producing EF-1 damage. The tornado then moved across the Missouri River crossing into Iowa, crossing Highway 30 and Union Pacific Rail line about one- mile east of the Iowa-Nebraska state line. Several trees were snapped and broken, producing EF-0 damage. The tornado then moved across bottom-land/agricultural areas, snapping or uprooting several trees and tipping center pivots, producing EF-0 to EF-1 damage. The tornado dissipated approximately 2 miles southwest of Modale, Iowa at 4:29 pm CT	202404300343-KOAX-NWUS53-LSROAX

L33	An EF1 tornado damage path began approximately 1 mile north of Pacific Junction, where the tornado was also reported by a trained spotter. The tornado crossed Highway 34 one mile east of Interstate 29 where it snapped trees. It then moved up and into the bluffs, where a home took a direct hit and lost large portions of the roof, and a large camper was flipped on its side. Trees were also snapped at this location. The tornado progressed through a forested area where many tree trunks were snapped. The end of the damage appeared to be near Pony Creek Park, just to the east of the Pony Creek Lake dam	202404300343-KOAX-NWUS53-LSROAX
L41	This EF3 tornado developed just east of the Eppley Airfield runway system, about one-quarter mile west of the Amelia Earhart Plaza and Lindbergh Plaza intersection. The tornado destroyed several aircraft hangars and flipped several untethered executive aircraft, producing EF-2 damage. The tornado moved northeast across the Missouri River and crossed Interstate 29 near mile marker 58. It widened to about one-quarter miles, damaging numerous homes and businesses between the interstate and Little Kiln Road. EF-3 damage was sustained to a residence along Little Kiln Road due to the collapse of most of the exterior and interior walls except for a few interior rooms. The tornado continued northeast, moving across Old Lincoln Highway about 1.5 miles south of Crescent. EF-2 damage to several homes occurred due to the major loss of the roof and exterior walls. A vehicle detail shop was destroyed. The tornado moved across mainly woodland areas before impacting a home and farm outbuildings near the intersection of Badger and Jefferson Avenues, where EF-2 damage was sustained to the home due to major roof damage. The tornado moved across agricultural and woodlands between 195th Street and Cougar Avenue, producing EF-1 damage to several manufactured homes and farm outbuildings. It continued northeast across mainly agricultural and woodland, producing EF-0 damage to farm outbuildings by removing large portions of their roofs and snapping large tree limbs. The tornado weakened near the intersection of 210th Street and Teakwood Road, producing intermittent damage to tree limbs. It crossed Interstate 880 about 7 miles west of the I-29 and I-880 interchange, or about 7 miles southeast of Missouri Valley. The tornado dissipated just north of Harrison-Pottawatomie County line in an agricultural field	202404300343-KOAX-NWUS53-LSROAX
L43	Delayed report. ASOS at Eppley Airfield. Measured wind gust as tornado moved very nearby	202405011359-KOAX-NWUS53-LSROAX

#	Remark	Product
L45	This EF3 tornado damage path began near Aspen Road, just west of 240th Street. The tornado tracked toward the north northeast, snapping trees and electrical poles as it went. A home was impacted along Chestnut Road with substantial roof damage. Two additional homes were directly impacted where the tornado crossed Highway 92. One of these sustained major roof damage while the other home had most external walls collapse while interior walls remained standing. Numerous trees were snapped and a large shed was completely destroyed at this location, while a large steel horse trailer was thrown more than a quarter mile. The tornado continued to Cottonwood road where it damaged a home and an outbuilding. The most significant damage along the track occurred at Dogwood road where a home was completely destroyed, and only the basement remained. Tree damage here was substantial as well with numerous snapped trunks. Residents of this home survived by seeking shelter in the basement bathroom, which was one of the few locations in the home not directly impacted by major flying debris. The tornado crossed Elmtree Road and Highway 6, and appears to have been at its widest near Highway 6 where it was approximately 800 yards wide. Another home was damaged near 270th and Hickory Road. The tornado continued northeast, damaging electrical poles, trees, and outbuildings all the way to where it ended near 295th and Juniper Road. The ending location is based upon photo evidence of spotters located southeast of the storm. A second tornado paralleled this storms track near the end, eventually intensifying and moving off to the northeast	202404300343-KOAX-NWUS53-LSROAX
L50	*** 1 FATAL, 3 INJ *** An EF3 tornado developed approximately 3 miles east of McClelland, and developed prior to the dissipation of the tornado that tracked near Treynor, so both were occurring at the same time, side by side. This was confirmed by photo and video evidence of storm spotters. This tornado moved toward the north northeast, damaging mainly trees and outbuildings or barns as it tracked up to Sumac Road and 330th Street. At this point, according to radar and storm damage indicators, the tornado rapidly intensified. An outbuilding was totally destroyed near Sycamore road, and the tornado caused extensive tree damage east of 330th Road, south of Minden. The tornado intensified further, and widened to approximately 800 yards as it impacted the town of Minden. Video and spotter reports indicate that there were multiple vortices within the tornado near Minden and points northeast, and there was evidence of narrow zones of the most intense damage which lines up very well with the multiple vortex tornado concept. In fact, there were damage indicators of EF-1 damage and high-end EF- 3 damage within only 100 yards of each other. The most intense damage was on the far east side of Minden. Numerous homes were uninhabitable and several homes were completely destroyed. There were also several sizeable metal buildings southeast of Main Street that were completely destroyed. The construction of these metal structures and the homes that were most impacted, in conjunction with the tree damage and damage to cars with few if any cars being lofted and thrown indicated that this was a very strong EF-3 tornado, near the top of the damage range for an EF- 3. The damage to the town of Minden was extensive, with three injuries and one fatality. The tornado continued northeast of Minden where it produced EF-3 damage at two homes along 345th Street. One of the homes was somewhat intact but was removed from its foundation and slid approximately 10 yards to the northeast. The other home had only small interior rooms remaining. It is worth noting that these two homes were 700 yards apart along the north-south street. EF-2 damage occurred along Whippoorwill Road. The tornado crossed Interstate 80 near 355th Street, flipping a semi, and produced damage nearly three quarters of a mile wide along York Road just north of Interstate 80. Tree and powerline damage continued to the northeast, with a home being very badly damaged near County Road M16 and 450th Street. A home was badly damaged, and a barn was destroyed less than one mile southeast of Tennant. The tornado appears to have been widest near 750th Street and Hackberry Road, at approximately 1 mile in width based on tree and powerline damage. At Highway 44, a home was destroyed along with substantial tree damage. Most walls of the home were standing, but a large automobile was thrown or rolled nearly a quarter mile. The tree and vehicle damage suggested that this location was a stronger section of the tornado. The tornado tracked approximately 1.5 miles northwest of Harlan, and began to turn more toward the north, significantly damaging at least 3 homes near Highway 59 as it crossed. It turned almost due north and traveled several miles along Linden Road, and just narrowly missed the town of Defiance. A second tornado developed just to the east of this one at this time, tracking along Oak Road and causing separate damage. Near Defiance, the damage overlapped damage from another, later, tornado. It also became rain-wrapped according to chaser video, and appears likely to have ended near the Crawford-Shelby county line. There is some potential based on radar data that this tornado tracked farther north into Crawford county, but early damage surveys did not identify a track continuation at this time	202404300343-KOAX-NWUS53-LSROAX

NCEI Storm Events Database

NOAA's reviewed record of significant weather, compiled by NWS offices after the event. Events overlapping the local date within 25 miles of the site, or listed for the site's county or forecast zone.

Magnitude: hail in inches; wind in knots (MG measured, EG estimated); tornadoes by EF rating. Tornado distance is to the straight line between the published start and end points, an approximation of the damage path.

Event narratives (as published)

#	Narrative
S01	This tornado developed about one quarter mile west of the West Q Road and 255th Street intersection in Western Douglas county where trees were knocked down and a farmstead sustained outbuilding damage. The tornado continued northeast crossing agricultural fields and flipping numerous center pivots, eventually crossing 252nd Street. The tornado caused EF-2 damage as it approached Highway 92, damaging numerous homes and striking an acreage northwest of the Highway 92 (West Center street) and Highway 275 intersection. Several center pivots were overturned as the tornado continued northeast crossing east of Highway 275, causing EF-2 damage to several acreages, homes, and outbuildings along Highway 275/240th Street. Continuing northeast, the tornado crossed 234th Street near Harney Street where it damaged a horse farm and an acreage as well as a home along Dodge Street/Highway 6 before crossing Dodge Street causing roof and outbuilding damage at the Junkstock Farm. The tornado crossed the Elkhorn River, damaging trees and flipping center pivots in an acreage along Blondo Street just south of the railroad tracks. The tornado continued into the western part of Elkhorn approximately one-half mile south-southwest of the intersection of West Maple Road and 216th Street. One home sustained high-end EF-2 damage losing large sections of its roofs. Another home just to the north had total destruction of the structure, resulting in EF-4 damage. The tornado moved across Prospect Hills Cemetery, damaging headstones, and moved across West Maple Avenue severely damaging a landscape business before entering the Ramblewood subdivision. Numerous homes in the subdivision received EF-3 damage with only small interior rooms standing. EF-3 damage persisted as the tornado continued north-northeastward damaging homes between 212th Street and Kestrel Parkway, again leaving only interior rooms standing. Two homes at the intersection of North 212th Street and Larimor Avenue were completely destroyed, resulting in a second instance of EF-4 damage. The tornado then crossed Fort Street about one-third of a mile east of 216th Street, causing the collapse of new development homes. This damage was also consistent with that of an EF-3 tornado. The tornado then veered to the northeast across mainly rural areas of northwestern Douglas County, between Fort Street and Military Road. By the time the tornado crossed Highway 31, it reached its peak width of 1 mile wide. EF-1 damage was noted in this area with several power poles and trees snapped. The tornado narrowed to about one-half mile wide and moved into residential development just northwest of the intersection of 180th Street and Military Road, where EF-1 damage was observed due to loss of roofs. The tornado then moved into Benningtonï¿½ï¿½ï¿½s Newport Landing neighborhood, causing high-end EF-2 damage by removing large sections of several home's roofs and collapsing some exterior walls. The tornado then moved across Bennington Lake, crossing just west of the intersection of Highway 36 and 168th Street, snapping the tops off of numerous trees. It then moved across agricultural land, damaging farm outbuildings southeast of the intersection of 168th Street and Dutch Hall Road, before crossing into Washington County. All walls of this home were collapsed. However, the walls were not attached to the foundation in a way that would discriminate between EF-3 and EF-4 damage. Thus, high-end EF-3 damage was determined. Peak estimated winds for this segment of the tornado's track were at 170 miles per hour. The maximum width of the tornado in this segment was 1450 yards, with an average width of approximately 900 yards.
S02	Quarter sized hail fell at the Omaha-Valley National Weather Service.
S03	This segment of the tornado is a continuation of the EF-4 tornado that tracked through western Douglas County. After crossing Dutch Hall road into southern Washington County, the tornado damaged homes and farm outbuildings between County Road 29 and County Road 31 from Dutch Hall Road to County Road 36. The width of the tornado at this time ranged from one-third to one-half mile wide. The most significant damage was sustained to a home, machine shop and horse barn, one-third of a mile southeast of the intersection of County Road 40 and County Road 29. Trees were snapped and debarked, the house was moved from its foundation, flat-bed and horse-trailers rolled or lofted, and the machine shop and horse barns destroyed. The storm damage survey following this tornado determined high-end EF-3 damage occurred here. At least one horse was killed, and several others were injured. After this, the tornado crossed the intersection of County Road 36 and County Road 31, producing EF-0 to EF-1 damage in the form of partial roof and siding loss to farm buildings and manufactured homes, plus the snapping of large tree limbs. As it approached State Highway 133, several homes and farm outbuildings sustained EF-2 damage due to the loss of roofs or exterior walls. Crossing Highway 133, the tornado was just less than one-half mile wide, and moved into residential areas generally between County Road 32 and US Highway 75. The most significant damage of the whole tornado track occurred near the intersections of County Road P30 and County Road 33 with the destruction of multiple homes. Several houses were rated with high-end EF-3 damage, and one house was rated as receiving EF-4 damage. Peak winds in this area were estimated to be 170 miles per hour. The tornado then crossed US Highway 75 about 2 miles southeast of Blair moving across the very southern portion of the Cargill plant. The tornado weakened and narrowed, but snapped power poles and derailed several empty rail container cars from the tracks, resulting in EF-1 damage. The peak width of the tornado during this segment of its track was 1900 yards wide, with an average width of around 1000 yards. The tornado continued into southwestern Harrison county in Iowa where it dissipated shortly after crossing US Highway 30.
S04	Shortly after the top of the hour, the office received a public report of half dollar sized hail in Blair. A few minutes after this report came in, there was another mPING report of golf ball sized hail, also in Blair.
S05	This segment is a continuation of the EF-4 tornado that went through western Douglas and Washington Counties. Upon entering far southwestern Harrison County, the tornado moved across the Missouri River, crossing Highway 30 and the Union Pacific Rail line about one mile east of the Iowa-Nebraska state line. Several trees were snapped and broken, producing EF-0 damage. The tornado then moved across bottomland and agricultural areas, snapping or uprooting several trees and tipping center pivots, producing EF-0 to EF-1 damage. The tornado dissipated approximately 2 miles southwest of Modale, Iowa at 4:29 pm CDT. Peak estimated winds during this segment of the tornado track were estimated at 90 miles per hour. The peak width of the tornado during its track in Harrison County was estimated to be around 350 yards, with an average width of 100 yards.

#	Narrative
S06	For the second time this day, quarter sized hail fell at the Omaha-Valley National Weather Service.
S07	The office received a public report of quarter sized hail on mPING.
S08	The office received a public report of quarter sized hail in La Vista.
S09	The office received several reports from the public and trained spotters in the Papillion area of hail ranging from 1 to 2 inches in diameter. The largest hail stone, measured at 2 inches, was reported in downtown Papillion by the public.
S10	The office received a report from the public of quarter sized hail.
S11	A report was received from the public via mPING of golf ball sized hail.
S12	A report was received from the public via mPING of quarter sized hail.
S13	A swath of quarter to golf ball sized hail was reported to have fallen across the Omaha metro just before 5 in the afternoon local daylight savings time. The largest hail was reported by the public north of downtown Omaha, where hail the size of golf balls fell.
S14	A tornado damage path began approximately 1 mile north of Pacific Junction, where the tornado was also reported by a trained spotter. The tornado crossed Highway 34 one mile east of Interstate 29 where it snapped trees. It then moved up and into the bluffs, where a home took a direct hit and lost large portions of the roof. A large camper was flipped on its side and trees were also snapped at this location. The tornado progressed north-northeast through a forested area where many tree trunks were snapped. The end of the damage path appeared to be near Pony Creek Park, just to the east of the Pony Creek Lake dam. Peak winds in this tornado were estimated at 100 miles per hour. The maximum measured width was 80 yards, with an estimated average width of 30 yards for this tornado track.
S15	The ground-level tornado circulation developed near 35th and Broadway in Council Bluffs, producing an intermittent track as it progressed north-northeast through a neighborhood, damaging trees, roofs, and apartment buildings. Peak winds were estimated to be at 110 miles per hour, with a peak width in this segment of the track of 75 yards, and an estimated average width of 50 yards. This tornado continued into Douglas County where it caused EF-2 damage at Eppley Airfield, then moved back into Pottawattamie County shortly after.
S16	The Pottawattamie County Emergency Manager reported golf ball sized hail in Carter Lake.
S17	This is a continuation of the first Pottawattamie County segment of this EF-3 tornado. In the prior segment, this tornado produced EF-0 and EF-1 damage to a neighborhood in western Council Bluffs, Iowa. This tornado crossed the Missouri River into Douglas County at the start of this segment of its track. This is where the first video evidence of a complete funnel in contact with the ground occurred. This video was taken at the Eppley Airport as the tornado did damage on the southeast side of the Eppley Airfield runway system. The tornado destroyed several aircraft hangars and flipped several untethered executive aircraft, producing EF-2 damage. The tornado continued northeast where it crossed the Missouri River for a second time and moved back into Pottawattamie County. Peak winds during this segment of the tornado track were estimated at 118 miles per hour. The maximum width while the tornado was in Douglas County was measured at 200 yards, with an average width during this track segment estimated at 100 yards.
S18	The Eppley Airfield ASOS station recorded a 61 mile per hour wind gust as a tornado moved very close to the station. This wind was determined to have not been a part of the tornado, but associated with the rear flank downdraft of the storm as it moved through.
S19	This is a continuation of the Douglas County segment of this EF-3 tornado. This is also the second time the tornado moved through portions of western Pottawattamie County. At the start of this segment, the tornado moved northeast across the Missouri River and crossed Interstate 29 near mile marker 58. It widened to about one-quarter mile, damaging numerous homes and businesses between the interstate and Little Kiln Road. The most intense damage was sustained to a residence along Little Kiln Road due to the collapse of most of the exterior and interior walls except for a few interior rooms. A storm damage survey the following day found this to be EF-3 damage, with peak winds estimated at 152 miles per hour. This damage point was when the tornado was at its strongest. The tornado then continued northeast, moving across Old Lincoln Highway about 1.5 miles south of Crescent. EF-2 damage to several homes occurred due to the major loss of the roof and exterior walls. A vehicle detail shop was also destroyed in this area. The tornado then moved across mainly woodland areas before impacting a home and farm outbuildings near the intersection of Badger and Jefferson Avenues, where EF-2 damage was sustained to the home due to major roof damage. After this, the tornado moved across agricultural and woodland areas between 195th Street and Cougar Avenue, producing EF-1 damage to several manufactured homes and farm outbuildings. Further to the northeast, the tornado produced EF-0 damage to farm outbuildings by removing large portions of their roofs and snapping large tree limbs. This tornado weakened near the intersection of 210th Street and Teakwood Road, producing intermittent damage to tree limbs. It crossed Interstate 880 about 7 miles west of the I-29 and I-880 interchange, or about 7 miles southeast of Missouri Valley. Shortly after crossing Interstate 880, the tornado briefly moved into far southern Harrison County where it dissipated half a mile north of the county line just to the east of Overton Avenue. The peak width of the tornado during this segment of its track was measured at 550 yards, with an average width estimated at 300 yards.

#	Narrative
S20	A tornado damage path began near Aspen Road, just west of 240th Street. The tornado tracked toward the north-northeast, snapping trees and electrical poles as it went. A home was impacted along Chestnut Road with substantial roof damage. Two additional homes were directly impacted when the tornado crossed Highway 92. One of these sustained major roof damage while the other home had most external walls collapse while interior walls remained standing. Numerous trees were snapped and a large shed was completely destroyed at this location while a large steel horse trailer was thrown more than a quarter mile. The tornado continued to Cottonwood Road where it damaged a home and an outbuilding. The most significant damage along the track occurred at Dogwood Road where a home was completely destroyed, and only the basement remained. Tree damage here was substantial as well with numerous snapped trunks. Residents of this home survived by seeking shelter in the basement bathroom, which was one of the few locations in the home not directly impacted by major flying debris. The tornado crossed Elmtree Road and Highway 6, and appears to have been at its widest near Highway 6 where it was approximately 800 yards wide. Another home was damaged near 270th and Hickory Road. The tornado continued northeast, damaging electrical poles, trees, and outbuildings all the way to where it ended near 295th and Juniper Road. The ending location is based on photo evidence of spotters located southeast of the storm. Peak winds in this tornado were estimated at 145 miles per hour. This tornado had a max width of 900 yards with an estimated average width of 500 yards.
S21	A tornado developed approximately 3 miles east of McClelland, and developed prior to the dissipation of the EF-3 tornado that tracked near Treynor. This was confirmed by photo and video evidence of storm spotters. This tornado moved toward the north-northeast, damaging mainly trees, outbuildings and barns as it tracked towards Sumac Road and 330th Street. At this point, according to radar and storm damage indicators, the tornado rapidly intensified. An outbuilding was totally destroyed near Sycamore Road, and the tornado caused extensive tree damage east of 330th Road, south of Minden. The tornado intensified further, and widened to approximately 1200 yards as it impacted the town of Minden. Video and spotter reports indicate that there were multiple vortices within the tornado near Minden and points northeast, and there was evidence of narrow zones of the most intense damage which lines up very well with the multiple vortex tornado concept. In fact, there were damage indicators of EF-1 damage and high-end EF-3 damage within only 100 yards of each other. The most intense damage was on the far east side of Minden. Numerous homes were uninhabitable and several homes were completely destroyed. There were also several sizeable metal buildings southeast of Main Street that were completely destroyed. The construction of these metal structures and the homes that were most impacted, in conjunction with the tree damage and damage to cars with few if any cars being lofted and thrown indicated that this was a very strong EF-3 tornado, near the top of the damage range for an EF-3. The damage to the town of Minden was extensive, with three injuries. A fourth person succumbed to their injuries after the event, resulting in the only direct fatality of this tornado outbreak in the OAX area. The tornado continued northeast of Minden where it produced EF-3 damage at two homes along 345th Street. One of the homes was somewhat intact but was removed from its foundation and slid approximately 10 yards to the northeast. The other home had only small interior rooms remaining. It is worth noting that these two homes were 700 yards apart along the north-south street. EF-2 damage occurred along Whippoorwill Road. The tornado crossed Interstate 80 near 355th Street, flipping a semi, and produced damage of a mile wide along York Road just north of Interstate 80. This tornado continued briefly into Harrison County and then into Shelby County. EF-1 damage was noted in Harrison County and EF-3 damage was found in Shelby County 2 miles west of Harlan, Iowa. Peak estimated winds in Pottawattamie County from this tornado were estimated at 160 miles per hour. Maximum width was estimated at 1900 yards, with an average width of 850 yards.
S22	This is the final segment for the EF-3 tornado that impacted Eppley Airfield and portions of western Pottawattamie County. The tornado crossed into far southern Harrison County less than a quarter mile from the York Road and Overton Avenue intersection. For the short time the tornado was in the county, it produced EF-0 damage to trees along a half-mile stretch of Overton Avenue. The tornado dissipated half a mile north of the county line just to the east of Overton Avenue. The peak width of the tornado in this segment of its track was measured at 75 yards with an average width estimated at 30 yards. Maximum estimated winds while this tornado was in Harrison County were 75 miles per hour.

Episode context (printed once per episode)

Episode 189914. On the morning of April 26th, a potent negatively-tilted shortwave trough ejected out into the central Plains. Upper air analysis shows a jet streak on the downstream side of this trough with substantial divergence aloft over Nebraska. At the surface, morning cloud cover and drizzle across much of eastern Nebraska and western Iowa quickly gave way to partly cloud skies as a warm front moved north through the area, just after noon. At the same time, thunderstorms initiated along a pacific front/dryline in south-central Nebraska. One supercell produced several tornadoes from south-central Nebraska into Boone County, resulting in an EF-2 tornado just west of Cedar Rapids. A second round of supercells initiated in Jefferson and Saline counties. These long-track supercells produced the worst tornado outbreak the Omaha WFO has seen in 10 years. 5 EF-3 tornadoes were surveyed, with several of these tornadoes just shy of an EF-4 rating. One of these EF-3 tornadoes impacted the northeast side of Lincoln, Nebraska where 70 people were reported trapped in a manufacturing plant that collapsed as the tornado passed. Another long-track EF-3 tornado hit portions of Elkhorn, Bennington and Blair, Nebraska. Eppley Airfield was hit by the third EF-3 tornado of the day, doing damage to aircraft hangars on the southeast side of the airport before hitting homes in far western Pottawattamie County. The last two EF-3 tornadoes of the day both impacted portions of Pottawattamie County. While one remained primarily in rural areas in the central part of the county, the final EF-3 of the day hit the town of Minden, Iowa head-on, resulting in 1 fatality and 3 injuries. This was the only fatality of the entire event. This tornado continued into Shelby County, narrowly missing the towns of Tenant and Harlan. A total of 24 tornadoes were confirmed across both Nebraska and Iowa portions of the Omaha CWA. The strongest tornado was the EF-3 that impacted Elkhorn and Blair, with peak estimated wind speeds at 165 miles per hour.

Episode 189915. On the morning of April 26th, a potent negatively-tilted shortwave trough ejected out into the central Plains. Upper air analysis shows a jet streak on the downstream side of this trough with substantial divergence aloft over Nebraska. At the surface, morning cloud cover and drizzle across much of eastern Nebraska and western Iowa quickly gave way to partly cloud skies as a warm front moved north through the area, just after noon. At the same time, thunderstorms initiated along a pacific front/dryline in south-central Nebraska. One supercell produced several tornadoes from south-central Nebraska into Boone County, resulting in an EF-2 tornado just west of Cedar Rapids. A second round of supercells initiated in Jefferson and Saline counties. These long-track supercells produced the worst tornado outbreak the Omaha WFO has seen in 10 years. 5 EF-3 tornadoes were surveyed,

with several of these tornadoes just shy of an EF-4 rating. One of these EF-3 tornadoes impacted the northeast side of Lincoln, Nebraska where 70 people were reported trapped in a manufacturing plant that collapsed as the tornado passed. Another long-track EF-3 tornado hit portions of Elkhorn, Bennington and Blair, Nebraska. Eppley Airfield was hit by the third EF-3 tornado of the day, doing damage to aircraft hangars on the southeast side of the airport before hitting homes in far western Pottawattamie County. The last two EF-3 tornadoes of the day both impacted portions of Pottawattamie County. While one remained primarily in rural areas in the central part of the county, the final EF-3 of the day hit the town of Minden, Iowa head-on, resulting in 1 fatality and 3 injuries. This was the only fatality of the entire event. This tornado continued into Shelby County, narrowly missing the towns of Tenant and Harlan. A total of 24 tornadoes were confirmed across both Nebraska and Iowa portions of the Omaha CWA. The strongest tornado was the EF-3 that impacted Elkhorn and Blair, with peak estimated wind speeds at 165 miles per hour.||Along the warm front the day prior, scattered thunderstorms developed along the Kansas-Nebraska border during the evening hours. Most of these storms were sub-severe, however, one thunderstorm produced severe hail in and north of Odell, Nebraska for around ten minutes just before 9 pm CDT.

Hail and lightning

NEXRAD radar hail detections within 15 miles

Radar-estimated maximum hail size for each storm cell on each radar scan (NEXRAD Level-III hail algorithm, via NOAA SWDI). These are estimates of hail aloft, not ground measurements; several radars may detect the same storm.

Lightning strike counts within 15 miles

Counts of NLDN lightning strikes per 0.1° grid cell (about 6–7 miles across) per UTC day, as published by NOAA NCEI. Point-level strike locations and times are licensed data and are not included. A UTC day runs from 7 PM to 7 PM Eastern Standard Time (adjust for other zones), so a count can include strikes outside the local date.

NCEI has not published lightning tiles for 2024-04 yet.

KOMA also reported thunder or lightning in 33 report(s), first at 12:52 AM CDT (see the observation log).

Sources and limitations

Data sources

Station measurements: NOAA NCEI Global Historical Climatology Network – hourly (GHCNh), per-station per-year files. Units converted from metric for display. Quality codes: '2', '3', '6', '7' mark suspect or erroneous values in the legacy source; lowercase letters mark GHCNh checks the value failed; unflagged values passed or were not checked.

Warnings and bulletins: NWS VTEC events and the verbatim text of NWS bulletins, retrieved from the Iowa Environmental Mesonet archive of NWS products (Iowa State University). Zones from api.weather.gov.

Local Storm Reports: NWS Local Storm Reports via the Iowa Environmental Mesonet. Preliminary; duplicates and corrections are reproduced as issued.

Storm Events: NOAA NCEI Storm Events Database bulk CSV (edition noted in that section).

Hail and lightning: NOAA NCEI Severe Weather Data Inventory (NEXRAD Level-III hail) and NCEI daily NLDN lightning tile counts.

Location: US Census Bureau Geocoder; timezone from coordinates (IANA tz database).

Area map: USGS The National Map topographic basemap (public domain), shown muted; records are drawn at their published coordinates. Storm report positions are often approximate.

Distances and bearings

Distances are great-circle miles from the site's coordinates; bearings are the direction from the site to the record (e.g. '4.6 mi WSW' means the record lies west-southwest of the site). A record's own position may be approximate: storm reports are often given to the nearest town or road.

What this report establishes

This report compiles public US government weather records for the selected location and date. Records near the site do not by themselves establish conditions at the exact property. Missing values are not zero, and 'not published yet' is different from 'no record'. It does not determine property damage, causation, insurance coverage or legal admissibility, and it is not a certified government record or expert opinion.

Retrieval and report identity

Data retrieved: Nov 5, 2026, 10:05 AM CST. Report ID: WE-2024-04-26-3BF16776DB95. Every source response used is stored unmodified; the hashes below identify those exact bytes, and the report ID is derived from them and their retrieval times, so this report can be regenerated byte-for-byte and verified.

BULLETIN - EAS ACTIVATION REQUESTED
Tornado Warning
National Weather Service Omaha/Valley Nebraska
303 PM CDT Fri Apr 26 2024

The National Weather Service in Omaha has issued a

* Tornado Warning for...
  Sarpy County in east central Nebraska...
  Northeastern Lancaster County in southeastern Nebraska...
  Western Douglas County in east central Nebraska...
  Southeastern Saunders County in east central Nebraska...
  Northwestern Cass County in southeastern Nebraska...

* Until 345 PM CDT.

* At 303 PM CDT, a confirmed tornado was located 3 miles west of
  Greenwood, or 13 miles northeast of Lincoln, moving northeast at 40
  mph.

  HAZARD...Damaging tornado and softball size hail.

  SOURCE...Weather spotters confirmed tornado.

  IMPACT...Flying debris will be dangerous to those caught without
           shelter. Mobile homes will be damaged or destroyed.
           Damage to roofs, windows, and vehicles will occur.  Tree
           damage is likely.

* The tornado will be near...
  Ashland around 310 PM CDT.

Other locations in the path of this tornadic thunderstorm include
Gretna, southwestern Omaha, Zorinsky Lake, Wehrspann Lake, Boys Town,
Elkhorn, Millard and Chalco.
```

```
PRECAUTIONARY/PREPAREDNESS ACTIONS...

To repeat, a tornado is on the ground. TAKE COVER NOW! Move to a
basement or an interior room on the lowest floor of a sturdy
building. Avoid windows. If you are outdoors, in a mobile home, or in
a vehicle, move to the closest substantial shelter and protect
yourself from flying debris.

BULLETIN - EAS ACTIVATION REQUESTED
Tornado Warning
National Weather Service Omaha/Valley Nebraska
426 PM CDT Fri Apr 26 2024
```

```
The National Weather Service in Omaha has issued a

* Tornado Warning for...
  Southwestern Pottawattamie County in southwestern Iowa...
  Eastern Sarpy County in east central Nebraska...
  Eastern Douglas County in east central Nebraska...
  North central Cass County in southeastern Nebraska...

* Until 515 PM CDT.

* At 425 PM CDT, a severe thunderstorm capable of producing a tornado
  was located near Louisville, or 11 miles southeast of Gretna,
  moving northeast at 35 mph.

  HAZARD...Tornado and hail up to two inches in diameter.

  SOURCE...Radar indicated rotation.

  IMPACT...Flying debris will be dangerous to those caught without
           shelter. Mobile homes will be damaged or destroyed.
           Damage to roofs, windows, and vehicles will occur.  Tree
           damage is likely.

* This dangerous storm will be near...
  Springfield and Cedar Creek around 430 PM CDT.
  Papillion and Walnut Creek Recreation Area around 435 PM CDT.
  Eastern Omaha, Bellevue, Ralston, Offutt AFB, La Vista, and
  Prairie Queen Recreation Area around 440 PM CDT.
  South Omaha around 445 PM CDT.

Other locations in the path of this tornadic thunderstorm include
western Council Bluffs, Midtown, Aksarben, Carter Lake, Benson,
Eppley Airfield and Florence.

PRECAUTIONARY/PREPAREDNESS ACTIONS...

TAKE COVER NOW! Move to a basement or an interior room on the lowest
floor of a sturdy building. Avoid windows. If you are outdoors, in a
mobile home, or in a vehicle, move to the closest substantial shelter
and protect yourself from flying debris.

BULLETIN - EAS ACTIVATION REQUESTED
Flash Flood Warning
National Weather Service Omaha/Valley NE
432 PM CDT Fri Apr 26 2024

The National Weather Service in Omaha/Valley has issued a

* Flash Flood Warning for...
  Northwestern Mills County in southwestern Iowa...
  Southwestern Pottawattamie County in southwestern Iowa...
  Eastern Douglas County in east central Nebraska...
  Northeastern Sarpy County in east central Nebraska...
  Southeastern Washington County in east central Nebraska...

* Until 800 PM CDT.

* At 432 PM CDT, Doppler radar indicated thunderstorms producing
  heavy rain across the warned area. Up to 1 inch of rain has
  fallen. Additional rainfall amounts of 1 to 2 inches are possible
  in the warned area. Flash flooding is ongoing or expected to begin
  shortly.

  HAZARD...Flash flooding caused by thunderstorms.

  SOURCE...Radar.

  IMPACT...Flash flooding of small creeks and streams, urban
```

```
          areas, highways, streets and underpasses as well as
          other poor drainage and low-lying areas.

* Some locations that will experience flash flooding include...
  Omaha, Council Bluffs, Bellevue, Papillion, Ralston, Boys Town,
  Offutt AFB, Millard, La Vista, Carter Lake, Crescent, Midtown,
  Aksarben, South Omaha, Benson, Florence, Eppley Airfield, Walnut
  Creek Recreation Area, Prairie Queen Recreation Area and Standing
  Bear Lake.

PRECAUTIONARY/PREPAREDNESS ACTIONS...

Turn around, don't drown when encountering flooded roads. Most flood
deaths occur in vehicles.

Be aware of your surroundings and do not drive on flooded roads.

BULLETIN - EAS ACTIVATION REQUESTED
Tornado Warning
National Weather Service Omaha/Valley Nebraska
454 PM CDT Fri Apr 26 2024

The National Weather Service in Omaha has issued a

* Tornado Warning for...
  Western Pottawattamie County in southwestern Iowa...
  South central Harrison County in southwestern Iowa...
  Northern Sarpy County in east central Nebraska...
  Southeastern Washington County in east central Nebraska...
  Eastern Douglas County in east central Nebraska...

* Until 545 PM CDT.

* At 454 PM CDT, a severe thunderstorm capable of producing a tornado
  was located over southeastern Omaha, moving northeast at 35 mph.

  HAZARD...Tornado and golf ball size hail.

  SOURCE...Radar indicated rotation.

  IMPACT...Flying debris will be dangerous to those caught without
           shelter. Mobile homes will be damaged or destroyed.
           Damage to roofs, windows, and vehicles will occur.  Tree
           damage is likely.

* This dangerous storm will be near...
  Eastern Omaha, northern Council Bluffs, Carter Lake, Crescent, and
  Eppley Airfield around 500 PM CDT.

PRECAUTIONARY/PREPAREDNESS ACTIONS...

TAKE COVER NOW! Move to a basement or an interior room on the lowest
floor of a sturdy building. Avoid windows. If you are outdoors, in a
mobile home, or in a vehicle, move to the closest substantial shelter
and protect yourself from flying debris.
